As an HR or safety professional, you understand the importance of creating a safe and friendly work environment, from increasing commitment in workers and boosting morale to avoid the financial losses associated with an injury. While we may be unaware of some risks in the workplace, we continue to learn new information that allows us to be proactive about our employees' well-being. The OSHA Act requires that employers provide employees with a workplace free of all known dangers. In order to be compliant with such, we must be sure that we are not at risk for exposing our employees to electric and magnetic fields (EMF) emitted from industrial work equipment. EMF can interfere with pacemakers or implanted defibrillators (ICD) and cause harm to the device or an individual.

EMF testing, a non-invasive assessment to monitor electric, magnetic and electromagnetic fields being emitted by machinery, helps you understand the potential risks to any employees with such implants. Whether or not health and safety programs are a direct responsibility of the HR team, you are the first to know if an employee has an ICD or pacemaker that could be affected. EMF testing allows you to take a proactive approach to understand the level of safety in your work environment and ensuring you will be prepared for the return of an employee with a new implant.

Contact us to learn more about how your facility can become EMF Workplace Ready™.

At PowerSmith Group, we know the value you place on your employees' safety and want to do our part to ensure you have all the information you need to make the best decisions for your workplace.
